

NOT CIRCUMCISED? LUCKY STIFF!

- The foreskin, not the head, is the most sensitive part of the normal, intact penis
- The moveable shaft skin of an intact penis facilitates intercourse, reducing friction and prolonging pleasurable sex for both male and female
- The foreskin aids in masturbation and foreplay; lubricants are optional
- An intact penis will have no circumcision scar; when erect, it will typically have less hair drawn up onto its shaft and will be on average somewhat larger than a circumcised penis
- The foreskin protects and lubricates the head or "glans" of the penis for the life of its owner
- 80-85% of the world's male population has intact genitals, including nearly all European males (please note that HIV/AIDS rates are actually lower in Europe than in America)

Note: This card approximates the amount of tissue missing from an adult circumcised penis
